This paper compares two approaches to meeting the data handling requirements of Intermedia, a hypermedia system developed at the Institute for Research in Information and Scholarship at Brown University. Intermedia, though written using an object-oriented programming language, relies on a traditional relational database management system for data storage and retrieval. We examine the ramifications of replacing the relational database with an object-oriented database. We begin by des ...

4 <u>Using Applications of Data Versioning in Database Application Development</u> Ramkrishna Chatterjee, Gopalan Arun, Sanjay Agarwal, Ben Speckhard, Ramesh Vasudevan May 2004 <u>Proceedings of the 26th International Conference on Software</u> <u>Engineering ICSE '04</u>

Publisher: IEEE Computer Society

Full text available: pdf(166.57 KB) Additional Information: full citation, abstract, citings, index terms

Database applications such as enterprise resource planning systems and customer relationship management systems are widely used software systems. Development and testing of database applications is difficult because the program execution depends on the persistent state stored in the database. In this paper we show that how versioning of the persistent data stored in the database can solve some critical problems in the development and testing of database applications can be solved by vers ...

5 Conceptual learning in database design

Yannis E. Ionnidis, Tomas Saulys, Andrew J. Whitsitt

July 1992 ACM Transactions on Information Systems (TOIS), Volume 10 Issue 3

Publisher: ACM Press

Full text available: pdf(2.00 MB)

Additional Information: <u>full citation</u>, <u>abstract</u>, <u>references</u>, <u>citings</u>, <u>index</u> <u>terms</u>

This paper examines the idea of incorporating machine learning algorithms into a database system for monitoring its stream of incoming queries and generating hierarchies with the most important concepts expressed in those queries. The goal is for these hierarchies to provide valuable input to the database administrator for dynamically modifying the physical and external schemas of a database for improved system performance and user productivity. The criteria for choosing the appropriate lea ...

6 <u>Databases: ODMG extension of composite objects in OODBMS: a proposal</u> Xiaoyan Lu, J. Wenny Rahayu, David Taniar

February 2002 Proceedings of the Fortieth International Conference on Tools Pacific:
Objects for internet, mobile and embedded applications CRPIT '02

Publisher: Australian Computer Society, Inc.

Full text available: pdf(859.97 KB) Additional Information: full citation, abstract, references, index terms

This paper proposes an extension of ODMG (Object Data Management Group) standard for the Object-Oriented Database Management Systems (OODBMS). The extension concentrates on composite objects, which provides a new paradigm, and also improves traditional OODBMS to meet the needs arising from the aggregation hierarchy. Currently in ODMG, the semantic of the aggregation relationship is explored at the modelling stage and is described in natural language. To formally specify and verify an aggregation ...

	A flexible and recoverable client/server database event notification system Eric N. Hanson, ICheng Chen, Roxana Dastur, Kurt Engel, Vijay Ramaswamy, Wendy Tan, Chun Xu February 1998 The VLDB Journal — The International Journal on Very Large Data Bases, Volume 7 Issue 1	
	Publisher: Springer-Verlag New York, Inc. Full text available: pdf(105.38 KB) Additional Information: full citation, abstract, index terms	
	A software architecture is presented that allows client application programs to interact with a DBMS server in a flexible and powerful way, using either direct, volatile messages, or messages sent via recoverable queues. Normal requests from clients to the server and replies from the server to clients can be transmitted using direct or recoverable messages. In addition, an application event notification mechanism is provided, whereby client applications running anywhere on the network can regist

	We consider the problem of similarity search in a very large sequence database with edit distance as the similarity measure. Given limited main memory, our goal is to develop a reference-based index that reduces the number of costly edit distance computations in order to answer a query. The idea in reference-based indexing is to select a small set of reference sequences that serve as a surrogate for the other sequences in the database. We consider two novel strategies for selecting references as	
10 ③	Beyond schema evolution to database reorganization Barbara Staudt Lerner, A. Nico Habermann September 1990 ACM SIGPLAN Notices, Proceedings of the European conference on object-oriented programming on Object-oriented programming systems, languages, and applications OOPSLA/ECOOP '90, Volume 25	
	Issue 10 Publisher: ACM Press	
	Full text available: pdf(979.63 KB) Additional Information: full citation, abstract, references, citings, index terms	
	While the contents of databases can be easily changed, their organization is typically extremely rigid. Some databases relax the rigidity of database organization somewhat by supporting simple changes to individual schemas. As described in this paper, OTGen	

supports not only more complex schema changes, but also database reorganization. A database administrator uses a declarative notation to describe mappings between objects created with old versions of schemas and their corresponding repre ...

11 Loading databases using dataflow parallelism Tom Barclay, Robert Barnes, Jim Gray, Prakash Sundaresan December 1994 ACM SIGMOD Record, Volume 23 Issue 4

	Full text available: pdf(1.49 MB) Additional Information: full citation, abstract, citings, index terms	
	This paper describes a parallel database load prototype for Digital's Rdb database product. The prototype takes a dataflow approach to database parallelism. It includes an <i>explorer</i> that discovers and records the cluster configuration in a database, a <i>client</i> CUI interface that gathers the load job description from the user and from the Rdb catalogs, and an <i>optimizer</i> that picks the best parallel execution plan and records it in a <i>web</i> data structure. The web describes th	
12	Hierarchical hippocratic databases with minimal disclosure for virtual organizations Fabio Massacci, John Mylopoulos, Nicola Zannone September 2006 The VLDB Journal — The International Journal on Very Large Data Bases, Volume 15 Issue 4 Publisher: Springer-Verlag New York, Inc. Full text available: pdf(705.84 KB) Additional Information: full citation, abstract	
	The protection of customer privacy is a fundamental issue in today's corporate marketing strategies. Not surprisingly, many research efforts have proposed new privacy-aware technologies. Among them, Hippocratic databases offer mechanisms for enforcing privacy rules in database systems for inter-organizational business processes (also known as virtual organizations). This paper extends these mechanisms to allow for hierarchical purposes, distributed authorizations and minimal disclosure su

13 ②	Optimization of join operations in horizontally partitioned database systems Arie Segev March 1986 ACM Transactions on Database Systems (TODS), Volume 11 Issue 1 Publisher: ACM Press Full text available: pdf(1.74 MB) Additional Information: full citation, abstract, references, citings, index	
	This paper analyzes the problem of joining two horizontally partitioned relations in a distributed database system. Two types of semijoin strategies are introduced, local and remote. Local semijoins are performed at the site of the restricted relation (or fragment), and remote semijoins can be performed at an arbitrary site. A mathematical model of a semijoin strategy for the case of remote semijoins is developed, and lower bounding and heuristic procedures are proposed. The results of comp

The semantics of objects and transactions in database systems are investigated. Userdefined predicates called consistency assertions are used to specify user programs. Three new correctness criteria are proposed. The first correctness criterion consistency is based solely on the users' specifications and admit nonserializable executions that are acceptable to the users. Integrity constraints of the database are maintained through consistency assertions. Th ...

16 <u>Timer-driven database triggers and alerters: semantics and a challenge</u>

Eric N. Hanson, Lloyd X. Noronha

December 1999 ACM SIGMOD Record, Volume 28 Issue 4

This paper proposes a simple model for a timer-driven triggering and alerting system. Such a system can be used with relational and object-relational databases systems. Timer-driven trigger systems have a number of advantages over traditional trigger systems that test trigger conditions and run trigger actions in response to update events. They are relatively easy to implement since they can be built using a middleware program that simply runs SQL statements against a DBMS. Also, they can c ...

17 Integrating reliable memory in databases

Wee Teck Ng, Peter M. Chen

August 1998 The VLDB Journal — The International Journal on Very Large Data

Bases, Volume 7 Issue 3

Full text available: pdf(123.18 KB) Additional Information: full citation, abstract, index terms

Recent results in the Rio project at the University of Michigan show that it is possible to create an area of main memory that is as safe as disk from operating system crashes. This paper explores how to integrate the reliable memory provided by the Rio file cache into a database system. Prior studies have analyzed the performance benefits of reliable memory; we focus instead on how different designs affect reliability. We propose three designs for integrating reliable memory into databases: non ...

Traditionally, the interface between a programming language and a database has either been through a set of relatively low-level subroutine calls, or it has required some form of embedding of one language in another. Recently, the necessity of integrating database and programming language techniques has received some long-overdue recognition. In response, a number of attempts have been made to construct programming languages with completely integrated database management systems. These lang ...

Decidable optimization problems for database logic programs

Stavros Cosmadakis, Haim Gaifman, Paris Kanellakis, Moshe Vardi January 1988 Proceedings of the twentieth annual ACM symposium on Theory of computing

Publisher: ACM Press

Full text available: pdf(1.43 MB)

Additional Information: full citation, abstract, references, citings, index

Datalog is the language of logic programs without function symbols. It is used as a database query language. If it is possible to eliminate recursion from a Datalog program &Pgr;, then &Pgr; is said to be bounded. It is known that the problem of deciding whether a given Datalog program is bounded is undecidable, even for binary programs. We show here that boundedness is decidable for monadic programs, i.e., programs where t ...

20 Efficient discovery of error-tolerant frequent itemsets in high dimensions

Cheng Yang, Usama Fayyad, Paul S. Bradley

August 2001 Proceedings of the seventh ACM SIGKDD international conference on Knowledge discovery and data mining

Additional Information: full citation, abstract, references, citings, index

We present a generalization of frequent itemsets allowing for the notion of errors in the itemset definition. We motivate the problem and present an efficient algorithm that identifies error-tolerant frequent clusters of items in transactional data (customerpurchase data, web browsing data, text, etc.). The algorithm exploits sparseness of the underlying data to find large groups of items that are correlated over database records (rows). The notion of transaction coverage allows us to extend th ...
